

Patient Information

Report Generated:	April 05, 2026 at 02:03 PM
Patient Name:	Nithya
Age:	45
Sex:	Male
Blood Pressure:	120 mm Hg
Cholesterol:	200 mg/dL
Fasting Blood Sugar > 120 mg/dL	No
Chest Pain Type:	Typical Angina
Resting ECG:	Normal

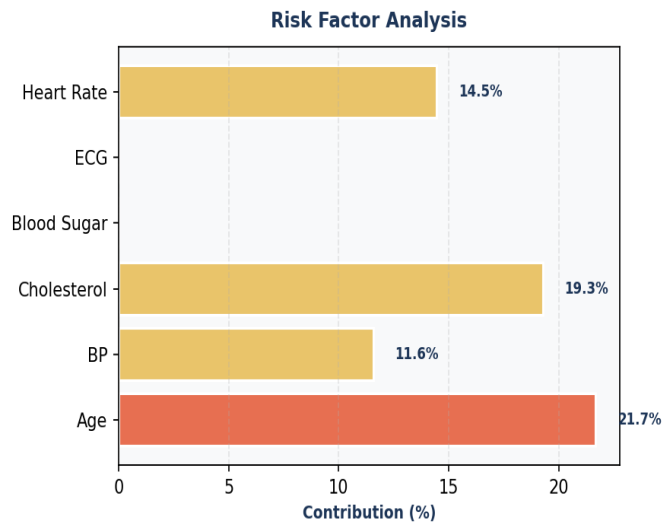

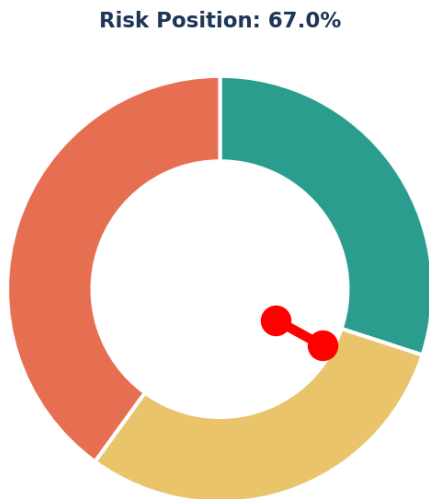

Risk Assessment

Heart Disease Risk Score	67.0%
Risk Category	■ High Risk

Simulated ECG Signal

Risk Visualization

Medical Recommendations

Your risk score indicates elevated risk. We strongly recommend consulting with a cardiologist for comprehensive evaluation including ECG, stress test, and personalized treatment plan. Early intervention can significantly improve outcomes.

Cardiovascular Health Tips

■ Nutrition

Maintain a balanced diet rich in fruits, vegetables, whole grains, and lean proteins. Limit saturated fats, trans fats, and sodium intake.

■ Exercise

Engage in at least 150 minutes of moderate aerobic activity or 75 minutes of vigorous activity per week, plus muscle-strengthening exercises.

■ Weight Management

Maintain a healthy weight (BMI 18.5-24.9). Even modest weight loss (5-10%) can significantly reduce cardiovascular risk.

■ Sleep

Get 7-8 hours of quality sleep nightly. Poor sleep is linked to increased risk of heart disease, obesity, and diabetes.

■ Avoid Smoking

Quit smoking and avoid secondhand smoke. Smoking cessation rapidly reduces cardiovascular risk.

■ Limit Alcohol

If you drink, do so in moderation (up to 1 drink/day for women, 2 for men). Excessive alcohol raises blood pressure.

■ Stress Management

Practice stress-reduction techniques like meditation, deep breathing, yoga, or mindfulness. Chronic stress affects heart health.

■ Regular Monitoring

Schedule regular check-ups to monitor blood pressure, cholesterol, blood sugar, and other cardiovascular risk factors.

Understanding Your Risk Factors

Key Cardiovascular Risk Factors:

- **Age:** Risk increases with age, especially after 45 for men and 55 for women
- **Family History:** Genetics play a role in heart disease susceptibility
- **Blood Pressure:** Hypertension ($\geq 140/90$ mmHg) strains the heart and damages arteries
- **Cholesterol:** High LDL ("bad") cholesterol and low HDL ("good") cholesterol increase risk
- **Diabetes:** Fasting blood sugar >120 mg/dL indicates diabetes, a major risk factor
- **Obesity:** Excess weight, especially around the waist, increases cardiac workload
- **Physical Inactivity:** Sedentary lifestyle contributes to multiple risk factors
- **Smoking:** Damages blood vessels, reduces oxygen, and increases clotting risk

IMPORTANT DISCLAIMER
